

$A_1 \times A_2$
type $(K, -1, n_1+n_2)$

A_2 , type $(K, -1, n_2)$
 $\omega(A_2) \in W(A_2) \cong K$

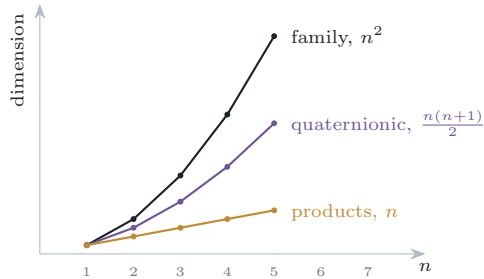

A_1 , type $(K, -1, n_1)$
 $\omega(A_1) \in W(A_1) \cong K$

$$\omega(A_1) \omega(A_2) = 2 \omega(A_1 \times A_2)$$

$$\bigwedge_K^{2n} (V_1 \oplus V_2) = \bigwedge_K^{2n_1} V_1 \otimes \bigwedge_K^{2n_2} V_2$$

so algebraicity passes from the factors to the product,
and at $n = 1$ the factors are divisors

every locus on which the class is known to be algebraic is a proper subvariety once $n \geq 2$
