

K splits $H^1(A, \mathbb{C})$ into two halves, and each half splits by Hodge type.

The two zeros are the first Riemann relation, $E = 0$ on $H^{1,0} \times H^{1,0}$ and on $H^{0,1} \times H^{0,1}$.
The upper right block is the one that moves the tangent space.

Both spaces have dimension n^2 . The composite depends on no basis and on no choice of ω on the line.
