

■ HC and $(F3')$ when $n \leq 5$ and $d \leq 3$, hence whenever $n \leq 3$ (Bloch–Srinivas; Conte–Murre)

▨ open in general; $(F3')$ if R is birational to a variety with $\text{Hdg}^2 = \text{Ab}^2$, HC if to an abelian fourfold

■ open in general

↔ for the varieties at the dot, $(F3')$, or HC, is equivalent to degree four on every fourfold

○ a first open case; $d = n$ whenever $H^{n,0}(X) \neq 0$

d : the least dimension of a closed subset supporting $\text{CH}_0(X)_{\mathbb{Q}}$;

$d \leq \dim R$, R the maximal rationally connected quotient of X
